ZURI

Personalise every guest journey, from menu to payout.

Founder Pitch Deck · AI menus · Smart ordering · Events ticketing

The simple version: ZURI is the AI-powered operating layer for restaurants, hotels, and events in Africa — one link for guests to browse, order, pay, or buy tickets; one dashboard for the business to run service and get paid.

THE 10-SECOND PITCH

"ZURI is Stripe-meets-Toast for African hospitality — with AI that actually understands local guests."

When someone asks "What is Zuri?" say this:

- We give any restaurant, hotel, or event a smart storefront in minutes.
- Guests scan a QR or use Zuri Tap — no app download.
- They browse an AI-personalised menu or buy tickets, pay on their phone.
- The business sees orders live, gets analytics, and receives payouts to their bank.

What category we play in:

- **Hospitality commerce infrastructure** — not just a QR menu.
- **Guest intelligence** — AI recommendations, trending, reorder, local languages.
- **Payments rail** — Paystack/Monnify, Naira-native, 1.5% on orders.
- **Events layer** — ticketing storefronts on the same platform.

THE PROBLEM

African venues run on chaos. Western tools weren't built for this reality.

For the guest

- Wait for a waiter, decode a paper menu, or download yet another app.
- Language barriers — menus rarely speak Hausa, Yorùbá, or Igbo.
- Peak-hour friction: shared tables, loud rooms, slow card terminals.
- Events: long queues, manual ticket lists, cash reconciliation nightmares.

For the business

- 5–7 disconnected tools: POS, WhatsApp orders, spreadsheets, Eventbrite, bank alerts.
- No real-time view of what's selling, what's trending, or what's running out.
- Staff bottleneck — every order passes through a human middleman.
- Finance teams reconcile manually; owners can't see margin until month-end.

The gap: Africa's hospitality economy is massive and mobile-first, but the software stack is either too expensive (global POS suites), too basic (static QR PDF menus), or too narrow (ticketing-only).

THE SOLUTION

One platform.

Menu → Order → Pay → Insight.

Scan	Guest opens link — no app
Browse	AI menu or tickets
Pay	Phone checkout + bank payout

What ZURI replaces

- Static QR menus → live, branded storefronts
- WhatsApp order chaos → structured order inbox
- Separate ticketing tools → same dashboard, same payouts
- Gut-feel decisions → Zuri Assist analytics & AI ops

Core product modules

- **Smart Storefront** — menu or event tickets, your brand
- **QR + Zuri Tap** — scan or 6-digit code, saved card checkout
- **Payments** — Naira payouts via licensed processors (Paystack/Monnify)
- **Zuri Assist** — guest AI + manager AI in one brain
- **Analytics** — sales, peaks, margins, market benchmarks

One brain for the floor and the guest.

On the guest menu (Growth+)

- **For You** — personalised picks based on taste & history
- **Trending** — what the room is ordering right now
- **Reorder** — one tap back to their usual
- Local language names: Hausa, Yorùbá, Igbo
- Dietary chips, upsells, taste-based sorting

On the business dashboard (Scale+)

- Revenue insights, forecasts, promo ideas, AI chat
- Live ops: rush alerts, anomalies, low-stock flags
- Market intelligence — anonymous Zuri Network benchmarks
- Customer intelligence & premium analytics
- CSV import for high-volume menus or ticket types

Why this matters: Competitors digitise the menu. ZURI digitises the *decision* — what to order, what to promote, when to prep, what to price.

Built for Africa's front-of-house reality.

Africa-specific design choices

- Naira-native pricing & payouts — no USD conversion friction
- Works on any smartphone browser — low bandwidth, no app store
- Peak-hour noise, shared tables, thousand-person events
- Guest menus in local languages — not English-only imports
- Monnify + Paystack — payments Africans actually use

Why the world needs this too

- Emerging markets = mobile-first commerce (same playbook as M-Pesa, Flutterwave)
- Hospitality is the #1 offline sector going digital post-COVID
- AI personalisation is the new table stakes — Africa will leapfrog, not catch up
- Events + F&B; convergence — concerts, pop-ups, food halls need one stack
- Exportable model: Nigeria → Ghana → Kenya → MENA → diaspora venues globally

70%+

Smartphone penetration in urban Africa

WHAT'S DIFFERENT

Not another QR menu. Not another POS.

	Static QR menus	Global POS (Toast, etc.)	Event platforms	ZURI
Setup time	Minutes	Weeks + hardware	Days	**Minutes**
African payments	Rarely	Limited	Limited	**Native Naira**
Guest AI personalisation	No	Add-on / expensive	No	**Built-in**
Menu + tickets unified	No	No	Tickets only	**Yes**
Local languages on menu	No	No	No	**Hausa/Yoruba/Igbo**
Price for small venue	Free–cheap	$100s/month	High fees	**Free → ■9,900/mo**
Manager AI copilot	No	Enterprise only	No	**Scale tier**

BUSINESS MODEL

SaaS + transaction revenue.
Aligned with venue success.

Subscription tiers (NGN/month)

- **Free** — QR ordering, text menu, orders inbox (try end-to-end)
- **Starter ■9,900** — photos, logo, AI menu upload from photo/PDF
- **Growth ■24,900** — analytics, Zuri Tap, guest AI menu, catalog presets
- **Scale ■59,900** — Zuri Assist dashboard, live ops, market intel, CSV import
- **Enterprise** — custom rollout for chains & large events

Transaction fees (on successful sales)

- **Menu orders:** 1.5% per transaction
- **Event ticketing:** 4% + ■50 per ticket sale
- Payments processed by licensed partners — ZURI does not hold funds

Revenue flywheel

- Free tier → viral QR adoption at venues
- Growth tier → sticky analytics + guest AI
- Scale tier → high-ARPU ops teams & chains
- Transaction fees → scale with GMV, not headcount

MARKET & PATH TO $1B

The TAM is huge.
The wedge is narrow and sharp.

Market sizing (conservative framing)

- **TAM:** $100B+ global restaurant/hospitality software + payments
- **SAM:** ~$8–12B Africa F&B; + events digitisation (Nigeria, Ghana, Kenya, SA)
- **SOM (5yr):** 50,000 active venues × ■25K avg MRR + 1.5% of ■500B GMV
- Ticketing adds high-value events: concerts, weddings, conferences

Comparable exits & valuations

- Toast (US POS) — $20B+ peak market cap
- Square / Block — payments + commerce OS
- Eventbrite, Ticketmaster — ticketing infrastructure
- Flutterwave, Paystack — African payments rails we plug into

How ZURI becomes a billion-dollar company

- **1. Land** — free QR menus; every table is a distribution node
- **2. Expand** — upsell AI, analytics, Tap; increase take rate on GMV
- **3. Network** — Zuri Tap = saved cards across venues (two-sided network)
- **4. Data moat** — Zuri Network benchmarks; best guest AI in African F&B;
- **5. Platform** — reservations, loyalty, supplier ordering, franchise ops
- **6. Geography** — Nigeria wedge → West Africa → continent → diaspora

Illustrative math: 100,000 venues × $200/yr SaaS + 1.5% of $50B annual GMV = $20M ARR + $750M payment revenue share → multi-billion platform at scale.

Pay with a code.
No scan. No friction.

How it works

- Business gets a 6-character Tap code in their dashboard
- Guest signs up once, saves a card to their Zuri Tap account
- Business sends payment request → guest confirms with Tap password
- Same payout rails as every other Zuri order

Why this is strategically huge

- Creates a **consumer identity layer** across all Zuri venues
- Repeat guests checkout in seconds — higher conversion, higher GMV
- Cross-venue data enables better personalisation (For You, Reorder)
- This is how Square Cash App started — payments identity → platform

Investor one-liner: "Zuri Tap turns every restaurant into a node on a pan-African hospitality payment network."

WHO IT'S FOR

Perfect for restaurants. Concerts. Hotels. Pop-ups. You.

Ideal first customers (Africa GTM)

- Busy Lagos/Abuja restaurants tired of WhatsApp orders
- Hotel restaurants & lounges wanting premium digital menus
- Event organisers selling tickets + F&B; at the same event
- Food halls & pop-ups needing fast setup, no hardware
- Cafés and bars wanting analytics without enterprise POS cost

Expansion customers

- Restaurant chains needing multi-location catalog presets
- Concert promoters & wedding planners (ticketing mode)
- Hotels with room service + restaurant + events
- Franchise groups needing market intelligence benchmarks
- Diaspora African restaurants abroad (same product, global cards)

WHERE WE ARE TODAY

Live product.
Real infrastructure.

What's built & shipping

- Full-stack platform live at zuriqo.com
- Business dashboard: orders, menu, analytics, QR, payments, reservations
- Guest storefront: menu + ticketing modes, AI personalisation
- Zuri Tap consumer payments with saved cards
- Paystack + Monnify payment integration
- Tiered SaaS with Growth/Scale AI feature gates
- Storefront customiser, event landing pages, font pairings

What we're proving next

- Venue density in Lagos — land-and-expand playbook
- Zuri Tap adoption — guest accounts per active business
- GMV growth — transaction fee revenue at scale
- Case studies: faster table turns, higher average order value
- Partnerships: hotel groups, event promoters, food aggregators

THE VISION

The operating system for African hospitality commerce.

Today, ZURI is the smartest way for a guest to order food or buy a ticket at an African venue.

Tomorrow, ZURI is the intelligence layer that runs the entire front-of-house — what guests see, what kitchens prep, what managers promote, and how money moves.

We are not building a feature. We are building the default infrastructure for how Africa eats, drinks, and experiences events — the way Stripe became default for online payments.

Mission	Less friction at the table, more flow at the back
Tagline	From menu to payout
Category	AI hospitality commerce

Copy-paste answers for real conversations.

"So what is Zuri?"

"It's like giving your restaurant or event a smart storefront and a manager AI in one. Customers scan, order or buy tickets on their phone, pay, and you get the money in your bank. No app download, no expensive POS."

"Why not just use a QR menu?"

"A QR menu is a PDF. Zuri is alive — it takes orders, takes payments, shows guests what's trending, speaks their language, and tells you what to promote before the rush."

"Why Africa?"

"Because our venues are mobile-first, high-volume, and multilingual — and global tools ignore that. We built for peak-hour Lagos, not quiet suburban America."

"Can this really be big?"

"Every table is a transaction. Africa has hundreds of thousands of venues and a growing events economy. We take SaaS plus a small cut of every order. Toast is worth $20B doing this in the US. Africa doesn't have

a winner yet — that's the opportunity."

"What makes you different?"

"Three things: AI that knows African guests, payments that settle in Naira, and one platform for both food and events. Nobody else combines all three."

Let's build the default hospitality layer for Africa.
